**Title:** <<NeuroSense AI: An LLM-Powered Neurological Health Assistant>>

#### Problem Statement:

<<Neurological disorders affect over one billion people globally, yet most patients cannot understand symptoms, interpret medical reports, or assess stroke risk without professional help. NeuroSense AI provides a dedicated LLM-powered platform with four modules — symptom mapping, stroke risk assessment, report simplification, and a neurology chatbot — delivering clear health guidance to all users.>>

**Objectives:** <<At least 4 bullet points>>

1. To develop an AI-powered symptom mapper that identifies neurological conditions with severity levels and specialist recommendations.
2. To build a stroke risk assessment module that computes a personalized risk score and delivers actionable prevention advice using LLM analysis.
3. To create NeuroChat, a neurology-focused chatbot that answers brain health queries with domain-restricted, clinically appropriate responses.
4. To implement a medical report analyzer that simplifies neurology reports into plain English with key term explanations and guided questions for the neurologist.
